

EP 1 651 873 B1 (No. 0002):

The document DE 201 06 561 shows an apparatus to connect a first profile bar with a second profile bar which lies with his front side on the profile side surface of the first profile bar. These profile bars have undercut longitudinal grooves along their longitudinal sides which include a connecting screw with screw head and screw thread, which is fixable in the area of the screw head within the undercut longitudinal groove of the first profile bar and, furthermore, can be screwed into a longitudinal bore of the second profile bar with its screw threads. The very screw head shows a denticulation on a plate-like collar which can be brought into functioning connection with a turning tool. The turning tool is a bar having on one of his ends an axially parallel denticulation formed into its end, which can be brought into touch with the denticulation of the collar.
